

InfinIAM Private Cloud Virtual Business System

Our service offering provides you with a fully functional business system “in the cloud.” You will have both the hardware and the essential business applications you need for business continuity.

InfinIAM’s offer is significantly different than the traditional offerings of competitors. We provide not only a basic hardware and operating system but also those applications that are key to your immediate productivity. Our base level system includes the following license free, open source applications:

- **Microsoft Exchange® Clone** email system including email security and active-sync for mobile devices. This full featured email system includes all the features of Microsoft Exchange® and integrates with Microsoft Outlook, smart phones, and other smart devices. This service includes email security for SPAM and Virus filtering; with a full web interface.
- **Microsoft Sharepoint® Alternative** file management system. This is a full featured file and document management system and includes a full featured web interface and desktop application integration for Microsoft Office.
- **Quickbooks®** Enterprise Solutions Database System. This system enables Quickbooks® company files to reside on the system and be accessed by multiple Quickbooks® users running Quickbooks® on their remote PC’s.
- **Apache Web System** with PHP, MySQL and OpenSSL. This is a full Apache implementation including SSL and database.
- **WordPress** Web Site. A pre-installed WordPress web site ready to for your use. This includes WordPress web administration to create and control content.
- **Automated Backup.** Your system is automatically backed up daily, with no user interaction is necessary.

Your Hardware Resources

The ICVPBS services provides a basic configuration with these resources:

- 1 Processor
- Up to 2GB of RAM
- 150GB of storage
- 1 public IP address
- 2 TB of monthly bandwidth usage

This base configuration can easily handle a company's operations for a staff of 20. For larger systems, upgrades with additional resources are available. Optional application servers and services, such as VOIP Virtual PBX, redundant servers for disaster recovery, managed firewall services, message archiving, SSL certificates, domain registration, DNS services, unrestricted/unlimited Internet access for remote workers or offices (DSL, T1, Ethernet, or Wireless; Private network also available), initial transfer of customer data to system, full management of the system applications, and other services are available at additional cost.

Competing Services

We offer significant price advantages over our competitors, such as hostway, liquidweb, and rackspace.

These competitors provide equivalent hardware resources, \$300 - \$400/month, but do not include the essential business applications that we include at no additional cost.

The value proposition we offer with open source applications included is that no system application licensing fees are necessary with our offering, and the customer gets a "ready-to-run" fully functional business system, not just a virtual system that the customer would still need to install all his applications on.

Further – this is not a shared system – this is a dedicated cloud environment, so all data and systems are isolated from other customer environments.

If a customer chooses a traditional cloud service, just adding hosted Microsoft Exchange® for 20 users to a traditional cloud scenario would be \$200+/month or in dedicated mode, application license fees plus client access license fees; adding Microsoft Sharepoint® services would require 4GB RAM at \$50+/month plus application license fees; adding Microsoft SQL® would be another \$50+/month.

Summary of Key Benefits

Our Private Cloud Virtual Business System is an ideal, fully featured, cost effective solution for your business continuity:

- Dedicated application servers, applications are not shared with other customers.
- Microsoft Exchange®, Sharepoint® and SQL® equivalents included.
- All business applications fully functional and ready to configure to the customer's needs.
- No license or per-user fees.
- Full system backed up daily.
- Many add-ons available including VOIP, unrestricted Internet access, private network, and managed firewall services,
